INSPECTION SAFETY

CED Technologies takes pride in delivering successful and safe inspections for our clients through a meticulous and structured process.

1 Pre-Inspection Client Meetings

Before investigations begin, our business development team collaborates with the client to outline key deliverables, such as scanning site items, collecting evidence, and creating simulation models.

These deliverables guide the selection of the most qualified engineer to lead the case and ensure a tailored and efficient approach to meeting the client's needs.

2 Inspection Preparation

Before the site inspection, engineers review case files, assess potential hazards, and prepare a detailed safety plan, including specialized protective equipment and PPE.

CED's engineers leverage their advanced expertise to address specific scenarios while adhering to best safety practices.

3 Site Protocols

Engineers arrive at the inspection early and confirm with the property manager that the site is clear for inspection.

CED Technologies supplies engineers with technologies to record their observations and expert knowledge throughout the inspection.

4 Post Inspection

Engineers use all recordings to create a systematic report. CED Technologies' engineers contact the clients to meet any additional deliverables.
